

FEATURES

- ▶ Efficiency up to 86%
- ▶ 1500VDC Isolation
- ▶ MTBF > 1,000,000 Hours
- ▶ 4:1 Wide Input Range
- ▶ CSA60950-1 Safety Approval
- ▶ Temperature Performance -25°C to +85°C
- ▶ Industry Standard Pinout
- ▶ UL 94V-0 Package Material
- ▶ Internal SMD Construction
- ▶ 3 Years Product Warranty

PRODUCT OVERVIEW

Minmax's MIW4000-Series Power modules are low-profile dc-dc converters that operate over input voltage ranges of 9-36VDC and 18-75VDC which provide precisely regulated output voltages of 3.3V, 5V, 12V, 15V, ±5V, ±12V and ±15VDC.

The -25°C to +85°C operating temperature range makes it ideal for data communication equipments, mobile battery driven equipments, distributed power systems, telecommunication equipments, mixed analog/digital subsystems, process/machine control equipments, computer peripheral systems and industrial robot systems.

The modules have a maximum power rating of 6W and a typical full-load efficiency of 86%, continuous short circuit and 50mA output ripple.

Notes

- 1 Specifications typical at Ta=+25°C, resistive load, nominal input voltage and rated output current unless otherwise noted.
- 2 Transient recovery time is measured to within 1% error band for a step change in output load of 50% to 100%
- 3 Ripple & Noise measurement bandwidth is 0-20MHz.
- 4 These power converters require a minimum output loading to maintain specified regulation, operation under no-load conditions will not damage these modules; however they may not meet all specifications listed.
- 5 All DC-DC converters should be externally fused at the front end for protection.
- 6 Other input and output voltage may be available, please contact MINMAX.
- 7 Specifications are subject to change without notice.

Test Setup

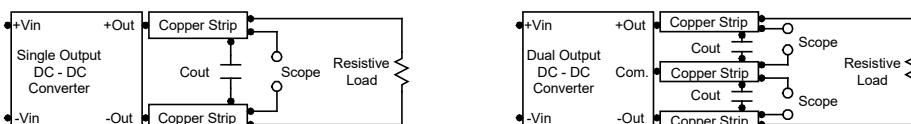

Input Reflected-Ripple Current Test Setup

Input reflected-ripple current is measured with a inductor Lin ($4.7\mu H$) and Cin ($220\mu F$, ESR < 1.0Ω at 100 kHz) to simulate source impedance. Capacitor Cin, offsets possible battery impedance. Current ripple is measured at the input terminals of the module, measurement bandwidth is 0-500 kHz.

Peak-to-Peak Output Noise Measurement Test

Use a Cout $0.47\mu F$ ceramic capacitor. Scope measurement should be made by using a BNC socket, measurement bandwidth is 0-20 MHz. Position the load between 50 mm and 75 mm from the DC-DC Converter.

Technical Notes

Overcurrent Protection

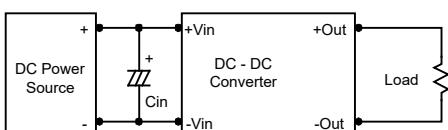

To provide protection in a fault (output overload) condition, the unit is equipped with internal current limiting circuitry and can endure current limiting for an unlimited duration. At the point of current-limit inception, the unit shifts from voltage control to current control. The unit operates normally once the output current is brought back into its specified range.

Input Source Impedance

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module.

In applications where power is supplied over long lines and output loading is high, it may be necessary to use a capacitor at the input to ensure startup.

Capacitor mounted close to the power module helps ensure stability of the unit, it is recommended to use a good quality low Equivalent Series Resistance (ESR < 1.0Ω at 100 kHz) capacitor of a $4.7\mu F$ for the 24V input devices and a $2.2\mu F$ for the 48V devices.

Output Ripple Reduction

A good quality low ESR capacitor placed as close as practicable across the load will give the best ripple and noise performance. To reduce output ripple, it is recommended to use $3.3\mu F$ capacitors at the output.

Maximum Capacitive Load

The MIW4000 series has limitation of maximum connected capacitance at the output. The power module may be operated in current limiting mode during start-up, affecting the ramp-up and the startup time. For optimum performance we recommend $680\mu F$ maximum capacitive load for dual outputs and $3000\mu F$ capacitive load for single outputs. The maximum capacitance can be found in the data sheet.

Thermal Considerations

Many conditions affect the thermal performance of the power module, such as orientation, airflow over the module and board spacing. To avoid exceeding the maximum temperature rating of the components inside the power module, the case temperature must be kept below $90^\circ C$.

The derating curves are determined from measurements obtained in a test setup.
