

**FEATURES**

- Industrial Standard SIP-7 Package
- Unregulated Output Voltage
- I/O Isolation 1000 VDC
- Operating Ambient Temp. Range -40°C to +85°C
- UL/cUL/IEC/EN 60950-1 Safety Approval

**PRODUCT OVERVIEW**

The MINMAX MAU100 series is a range of 1W DC-DC converters in a small SIP Package featuring I/O isolation of 1000VDC.

An excellent efficiency allows an operating temperature range of -40°C to +85°C. These converters offer an economical solution for many applications where a voltage has to be isolated i.e for noise reduction, ground loop elimination, digital interfaces or for board level power distribution.

**Notes**

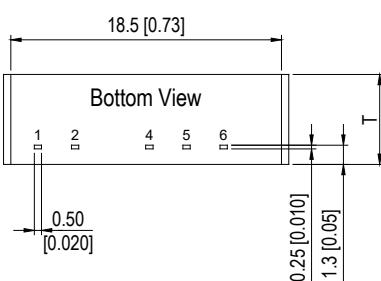

- 1 Specifications typical at  $T_a=+25^\circ\text{C}$ , resistive load, nominal input voltage and rated output current unless otherwise noted.
- 2 These power converters require a minimum output loading to maintain specified regulation, operation under no-load conditions will not damage these modules; however they may not meet all specifications listed.
- 3 We recommend to protect the converter by a slow blow fuse in the input supply line.
- 4 Other input and output voltage may be available, please contact MINMAX.
- 5 Specifications are subject to change without notice.
- 6 The repeated high voltage isolation testing of the converter can degrade isolation capability, to a lesser or greater degree depending on materials, construction, environment and reflow solder process. Any material is susceptible to eventual chemical degradation when subject to very high applied voltages thus implying that the number of tests should be strictly limited. We therefore strongly advise against repeated high voltage isolation testing, but if it is absolutely required, that the voltage be reduced by 20% from specified test voltage. Furthermore, the high voltage isolation capability after reflow solder process should be evaluated as it is applied on system.

## Test Setup

### Peak-to-Peak Output Noise Measurement Test

Use a  $C_{out}$   $0.33\mu F$  ceramic capacitor. Scope measurement should be made by using a BNC socket, measurement bandwidth is 0-20 MHz. Position the load between 50 mm and 75 mm from the DC-DC Converter.

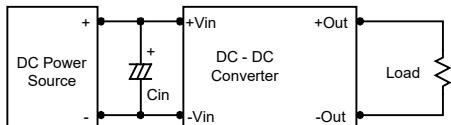

## Technical Notes

### Maximum Capacitive Load

The MAU100 series has limitation of maximum connected capacitance at the output. The power module may be operated in current limiting mode during start-up, affecting the ramp-up and the startup time. For optimum performance we recommend  $100\mu F$  maximum capacitive load for dual outputs and  $220\mu F$  capacitive load for single outputs. The maximum capacitance can be found in the data sheet.

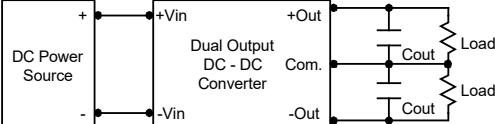

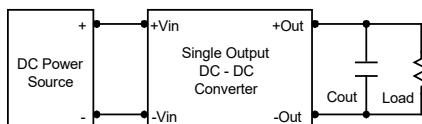

### Input Source Impedance

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module. In applications where power is supplied over long lines and output loading is high, it may be necessary to use a capacitor at the input to ensure startup. Capacitor mounted close to the power module helps ensure stability of the unit, it is recommended to use a good quality low Equivalent Series Resistance (ESR <  $1.0\Omega$  at 100 kHz) capacitor of a  $2.2\mu F$  for the 5V input devices, a  $1.0\mu F$  for the 12V,15V input devices and a  $0.47\mu F$  for the 24V devices.

### Output Ripple Reduction

A good quality low ESR capacitor placed as close as practicable across the load will give the best ripple and noise performance. To reduce output ripple, it is recommended to use  $1.0\mu F$  capacitors at the output.

### Thermal Considerations

Many conditions affect the thermal performance of the power module, such as orientation, airflow over the module and board spacing. To avoid exceeding the maximum temperature rating of the components inside the power module, the case temperature must be kept below  $105^{\circ}C$ . The derating curves are determined from measurements obtained in a test setup.
